

Editorial

This inaugural issue of *Current Analytical Chemistry* comprises a number of important reviews on the use of NMR spectroscopy for study of supra- and biomolecular systems, advances in head space gas chromatography, recent developments in chromatographic enantioseparations, ligand-exchange chromatography of amino acids, mass spectroscopic techniques for analysis of glycoproteins and glycans, open tubular electrochromatography and other exciting areas.

It is hoped that “*Current Analytical Chemistry*” will soon emerge as the leading review journal in the field of analytical chemistry.
