

## Editorial

This inaugural issue of “Current Pharmaceutical Analysis” presents comprehensive reviews written by eminent experts on a number of important topics including in high-throughput bioanalytical LC-MS/MS methods, identification techniques in proteomics using new analytical and bioinformatic strategies, solid-phase microextraction techniques, fluorescent chiral derivatisation reagents, role of cytokines in pharmaceutical and histopathological analysis, and antagonists of endothelin receptors for drug development and physicochemical profiling by capillary electrophoresis.

It is hoped that “Current Pharmaceutical Analysis” will soon become an indispensable journal for researchers in this field.
